National University of Science and Technology (NUST)

# Estimation

Estimation is a process by which we obtain an estimate of the true but unknown value of a population parameter by using the sample observations  $X_1, X_2, \dots, X_n$  from the population. For example, a poll may be used to estimate the proportion of students in a university that classes may start at 8 AM.

# Estimates and Estimators

- **Estimator:** An estimator is a rule or formula that is used to estimate the population parameter.  
For example  
 $\bar{X}$  is used to estimate  $\mu$ .  
 $S$  to estimate  $\sigma$ .
- **Estimate:** An estimate is a numerical value of the unknown parameter obtained by applying estimator, to a sample  $X_1, X_2, \dots, X_n$  from the population. Example  
 $\bar{X} = 66.5$  or 61 to 68

# Types of Estimation

- **Point Estimate:** Single number that can be regarded as the most plausible value of parameter
- **Interval Estimate:** A range of numbers, called a confidence interval indicating, can be regarded as likely containing the true value of parameter

## POINT ESTIMATES

SINGLE NUMBER

## CONFIDENCE INTERVAL ESTIMATES

INTERVAL

# Interval Estimation

A confidence interval (or interval estimate) is a range (or an interval) of values used to estimate the true value of a population parameter. A confidence interval is sometimes abbreviated as CI. A confidence level is the probability  $1-\alpha$  (often expressed as the equivalent percentage value) that is the proportion of times that the confidence interval actually does contain the population parameter, assuming that the estimation process is repeated a large number of times.

# Confidence Interval Estimates of a Population Mean

To compute a confidence interval for the population mean  $\mu$ , we have to see whether or not

- The population is normal,
- The population standard deviation is known
- The sample size is large or small

# Confidence Interval Estimates of a Population Mean

The possible cases are listed below

- **Normal Population with  $\sigma$  known**
- **Normal Population with  $\sigma$  unknown**
  - $\sigma$  unknown and sample size large ( $n \geq 30$ )
  - $\sigma$  unknown and sample size small ( $n < 30$ )
- **Non Normal Population with  $\sigma$  known or unknown (Large Samples).** The central limit theorem tells us that for large sample sizes, the sampling distribution of the mean  $\bar{X}$  is approximately normal, even though the population sampled is non normal

# Confidence Interval Estimates of a Population Mean

	$n \text{ large}(n > 30)$	$n \text{ small}(n \leq 30)$
$\sigma \text{ known}$	$\bar{X} \pm z_{\alpha/2} \frac{\sigma}{\sqrt{n}}$	$\bar{X} \pm z_{\alpha/2} \frac{\sigma}{\sqrt{n}}$
$\sigma \text{ unknown}$	$\bar{X} \pm z_{\alpha/2} \frac{S}{\sqrt{n}}$	$\bar{X} \pm t_{\alpha/2(n-1)} \frac{s}{\sqrt{n}}$

Sample standard deviation:  $S = \sqrt{\frac{\sum(x_i - \bar{x})^2}{n}}$ , For  $z$

Sample standard deviation:  $s = \sqrt{\frac{\sum(x_i - \bar{x})^2}{n-1}}$ , for  $t$

Population Standard deviation:  $\sigma = \sqrt{\frac{\sum(x_i - \mu)^2}{N}}$

# Question 1

A company is planning a large telephone survey and is interested in assessing how long it will take. In a short pilot study, 40 people are contacted by telephone and asked the specified set of questions. The times of these telephone surveys have a sample mean of 9.39 minutes with standard deviation of 1.041 minutes. Construct a 95 % confidence interval.

## Question 2

An article in the journal of material engineering describes the loads of specimens as following information 15.4, 11.4, 19.5, 10.1, 18.5, 14.1, 8.8, 14.9, 7.9, and 11.4. If population standard deviation is 4 find the 99% confidence interval for the mean.

## Question 3

In order to ensure efficient usage of a server, it is necessary to estimate the mean number of concurrent users. According to records, the average number of concurrent users at 100 randomly selected times is 37.7, with standard deviation 9.2. Construct a 92 % confidence interval.

## Question 4

A random Sample of 10 boys had the followings I.Q's  
70, 120, 110, 101, 88, 83, 95, 107, 100, and 98.

Find the 95% confidence interval for the population mean. Assume that IQ's are normally distributed and the variance is not known.
